**PROFESSIONAL REFLECTION ORIENTED FOCUS ON INQUIRY-BASED LEARNING and EDUCATION THROUGH SCIENCE** 

PROFILES TYPE INQUIRY LEARNING MODULES Dr. Bulent CAVAS Published in December 2018 Cork, Ireland http://www.profiles-project.eu Publisher: International Council for Associations for Science Education (ICASE) Copyright year 2018 © by Bulent Cavas ISSN: 2663-0699

*PROFILES project is made possible by a grant from the European Commission's* 7<sup>th</sup> Framework program and coordinated by Freie University from Germany with 21 Partners including DEU and ICASE.

# **INTRODUCTION**

PROFILES is a network project scattered across Europe and even beyond Europe. This project is carried out with the participation of 22 partner institutions including Dokuz Eylül University from 20 countries. The focus of the PROFILES project is professional reflection-oriented instruction. The focus is on increasing the scientific, pedagogical and educational competencies of the teachers, especially those related to inquiry-based science education (IBSE) and the teaching methods that support this education.

The innovative aspect of PROFILES is to support teachers by effectively using existing science teaching materials and by organizing long-term pre-service and in-service professional development programs. PROFILES professional development programs are prepared by taking the opinions of the individuals and institutions involved in the training and taking into account their needs.

The purpose of this book is to present the knowledge of science teachers by developing various learning modules related to the 3 Stage model used in the PROFILES project.

Prof. Dr. Bulent CAVAS

# PROFILES TYPE INQUIRY LERNING MODULES

# WHAT IS PROFILES PROJECT?

PROFILES is a Science Education project supported by the European Union 7th Framework Program. 21 institutions from 19 different countries cooperated for the PROFILES project.

**PROFILES** Countries

PROFILES conducts inquiry-based science teaching by increasing the self-confidence of teachers by adopting more effective teaching methods, and by the support of researchers and institutions related to education. In this way, PROFILES contributes to a better understanding of the changing objectives of science teaching in schools.

The innovative aspect of PROFILES is to support teachers by effectively using existing science teaching materials and by organizing long-term pre-service and in-service professional development programs. PROFILES professional development programs are prepared by taking the opinions of the individuals and institutions concerned with the education and taking into account the needs of the students.

PROFILES Researchers in Berlin Meeting

The project is based on teacher cooperation. The aim of this cooperation is to use teaching materials in science courses, which are targeted in collaboration with teachers, which include science subjects, which adopt inquiry-based science teaching and can be used as examples for other science subjects. Long-term professional development programs designed to reflect the challenges experienced by participating teachers will increase teachers' creative thinking, scientific problem solving and socio-scientific learning environments. In these learning environments, the students will develop their personal competences such as their internal motivations for learning science and their ability to make decisions and conduct scientific inquiry.

#### Klagenfurt Meeting

The project carries out the sharing of methods and approaches with leading teachers. These teachers play an important role in the training of other teachers in the pre-service and in-service level and in organizing workshops for other people and institutions related to education at the national level. The PROFILES project focuses on the secondary education level, in which open inquiry-based approach is one of the objectives of science teaching. In this context, PROFILES attaches great importance to the motivation of students to be internally (to be relevant to the student, to make the learning meaningful to the students) and to the environment (teacher's support and encouragement).

## **PROFILES PHILOSOPHY: 3 STAGE MODEL**

The three-stage model is based on socio-scientific subjects and the general characteristics are as follows:

• Start an interesting situation (as a social or student-familiar situation) for students (as a group),

• Discover the science behind the scenario in the context of the scenario that is introduced within the class discourse,

• Developing science learning through research-based learning method. - Various forms of research are initiated by the scientific question (s) in the script.

• Reinforcing science education by applying the concept of science attained as a result of the scenario,

• Completion of the scenario again in the context of socio-scientific or other decision-making processes, taking into account the interest of the students and completing the science education within the framework of social or daily life.

In this 3-stage continuous flow model where the steps lead each other respectively:

#### 1. Stage

The social scenario (for example, a social problem with a scientific element) is introduced and discussed. Then, students are guided to realize that there is a gap in their scientific understanding and then to express them in the form of appropriate scientific questions or questions for their research.

#### 2. Stage

It leads to the solution of the scientific problem based on research. This stage is an important stage in terms of both teaching time and the situation or content-based program. At this stage, intensive scientific process skills are used.

#### 3. Stage

At this stage, the students use the results obtained in the second stage to solve the initial problem condition. They demonstrate the extent to which their results are suitable for the solution of the problem and realize the decision-making mechanisms.

# MODULES

# HOW HAPPY ARE YOU AND YOUR FAMILY WITH THE ELECTRICITY BILL? \*

8<sup>th</sup> Grade science and technology module on determining energy consumption at home

# Abstract

This module leads to a decision making activity, designed to consolidate learning about consuming energy, and energy saving, taking examples from everyday life and to introduce the electrical energy and power. It involves the reading of an electricity bill and checking that the calculation of the bill is correct. It introduces students to the (kilo) watt as a unit of power and the kilowatt hour as the unit used in the home for energy consumption.

Section	ons included	
1.	Student activities	Describes the scenario in more detail and the tasks the
	(for students)	students should perform
2.	Teaching guide	Suggests a teaching approach
3.	Assessment	Gives suggested formative assessment strategies
4.	Teacher notes	Gives expectations of calculations to be carried out by
		students

#### Acknowledgement

This module has been adapted from that developed under the PARSEL project (**www.parsel.eu**) as part of an EC FP6 funded project (SAS6-CT-2006-042922-PARSEL) on Popularity and Relevance of Science Education for scientific Literacy

#### **Overall Objectives/Competencies:**

The students are expected to:

1. concerning the use of electrical energy and electrical power

- 1.1. Realize that the amount of energy that devices working with electrical energy consume per time differs
- 1.2. Define the electrical energy that devices working with electrical energy consume per time as the power of that device.
- 1.3. Express that electrical power units are named as watt and kilowatt
- 1.4. Realize that the amount of electrical energy consumed by devices working with electical energy changes by power of devices and time in which devices run.
- 1.5. Express that the amount of energy consumed is named as "watt\*second and kilowatt\*hour"
- 1.6. Express the measures that should be taken for the consciously use of electrical energy

Curriculum content: power as (kilo)watts, energy as kilowatt hour,

**Kind of activity:** Designing a questionnaire, calculations involving (kilo) watts and kilowatt hours, decision making discussion on realistic ways to reduce the electricity bill.

#### Anticipated time: 4 lessons

This unique teaching-learning material is intended to guide the teacher towards promoting students' scientific literacy by recognising learning in 4 domains – intellectual development, the process and nature of science, personal development and social development.

Its uniqueness extends to an approach to science lessons which is designed to follow a 3 stage model. For this the approach is intentionally from society to science and attempts to specifically meet student learning needs.

This uniqueness is specifically exhibited by:

- 1. a motivational, society-related and issue-based title (supported in the student guide by a motivational, socio-scientific, real life scenario);
- 2. forming a bridge from the scenario to the scientific learning to be undertaken;
- 3. student-centred emphasis on scientific problem solving, encompassing the learning of a range of educational and scientific goals;
- 4. utilising the new science by including in socio-scientific decision making to relate the science acquired to societal needs for responsible citizenship

# How Happy are You and Your Family with the Electricity Bill?

# **Student Activities**

#### The Scenario

Today, thanks to technological achievements, more and more equipment needs electric power to operate. Think what would happen if there was a black-out right now! What would be out of action? Unfortunately, as a result of the heavy use of electrical devices, the household electricity bill has become an important part of the family budget. But are you happy with this? Would you be interested in influencing the members of your family to see how it might be possible to reduce this bill? What devices are large users of electricity? Are they essential?

Below is an example of an Electricity Bill:

	GÜNDÜZ	PUANT	GECE
Son Endeks	4811,000	2633.000	3064.000
Ilk Endeks	4667,000	2560.000	2990.000
(+/-) Kwh		20001000	19901000
Trato Kaybi			
Tüketim	144,000	73,000	74 000
Birim Fiyat	0.162684		
Tüketim Tutarı	47.34		
	Per.Sat.Hiz.Bd.	llet. Sis.Kul.Bd.	Dağıtım Bedeli
Birim Fiyat	0.001703	0.004596	0.025908
Tutar	0.50	1 34	7 54
Sözleşme Gücü	5.64	DEMAND	
Demand (kW)	5.01	Çarpan	
Güç Aşımı		Gösterge	
Güç Tutarı		Güç Birim Fiyat	
Güç Aşımı Tutarı		G.Aşımı Birim Fiyat	
E.Amade K.Bed.		Gerilim Trafo Oranı	
Enerji Tutarı	56.72	Akım Trafo Oranı	L
Enerji Fonu	0.47	Günlük Ort. Tüketim	5 596
TRT Payı	0.95	İlk Okuma	03 06 2009
Bel.Tük. Ver.	2 37	Son Okuma	24 07 2009
(+/-) Tutar		Okuma Saati	11.08 04
K.D.V.	10.89	Tebliğ Tarihi	24 07 2009
Teşvik İndirimi	10107	Ekip	61.01.6000
Kira Bakım		Sonraki Okuma Dön.	
Güç Bedeli		Yuvarlama	+0.00
FATURA TUTARI		71,40 TL	.0.00

#### Your Task

Within the whole Class:

- 1. Discuss/compare different electricity bills and find out which parameters/factors contribute to the total amount paid. Mention which of them are "internal" (from the family) and which are "external" (from the state).
- 2. Discuss the questions that will be included to create a questionnaire for the proposed research to find out which appliances are used I the home and for how often.

#### In Groups:

- 1. Each group is required to put forward 5 questions in a short time.
- 2. Discuss the questions and from the sources create a common questionnaire.
- 3. Each member of the group takes the responsibility to give the questionnaire to her/his family, plus one more family and bring responses to the next class.
- 4. Decide the selection of different electrical equipment for each group to study power, energy transformation and energy consumption in a period of time.
- 5. Design and carry out an experimental investigation to determine the consumption of each equipment selected.

#### In Groups:

- 1. Look over a part of the completed questionnaire (2 3 questions per group) and present the outcomes in bar diagrams or tables.
- 2. Prepare a presentation of the experimental results (measurements, calculations, etc).
- 3. Discussion and presentation of the conclusions of the equipment studied.

#### In Groups:

- 1. Fill in the table given in this worksheet
- 2. Answer the question given under the table
- 3. Please note that this task will be completed at the second lesson, because students needs to investigate at their homes.

#### As a Class:

- 1. Presentation, discussion and comparison of each group's outcomes.
- 2. Reach final conclusions on: How it might be possible to reduce the electricity Bill.

What is meant by power and how important is it to be aware of this in determining items to reduce on the electricity bill?

Protecting the environment (power stations, fuels needed)

Effect on the State budget (fuels imported)

3. Discuss whether people are generally happy with their electricity bills or whether they would welcome guidance on how to reduce the bills (bearing in mind the percentage reduction you might be able to put forward) and determine certain ideas as proposals in order to change habits on consuming electric energy.

I in the table using 5 different equipments. One example is given in the table.				
The name	of the	power as Watts	Energy as kilowatt hour	
equipment				
Iron		2400 W	2.4 KW-hour	

#### Fill in the table using 5 different equipments. One example is given in the table.

- 1. According to the table, which equipment use most electrical energy?
- 2. Look at the picture below and search time for each equipments

# How Happy are You and Your Family with the Electricity Bill?

# **Teaching guide**

The activity relates to:

- Reinforcing an appreciation of the electric energy demands in every day life
- Being familiar with electrical energy consumption in a house
- Educating energy conscious citizens
- Introducing the concept of power

#### Lesson Learning Outcomes

#### Lesson 1

At the end of this lesson, students are expected to be able to:

- Look at an electricity bill
- Devise a questionnaire

#### Lesson 2

At the end of this lesson, students are expected to be able to:

- Analyse the questionnaire
- Determine appliances using most electricity
- Determine appliances used the most
- Read the electricity meter
- Fill in the table given in the students worksheet

#### Lesson 3

At the end of this lesson, students are expected to be able to:

- Understand the meaning of power and its units
- Understand the meaning of energy and its units
- Determining appliances that use much power

#### Lesson 4

At the end of this lesson, students are expected to be able to: Reach a justified decision whether the household is happy with its electricity bill

#### Suggested Teaching Strategy

- 1. The lesson starts from the scenario and by brainstorming ideas by students
- 2. Students are divided into groups to plan the development of their project
- 3. While discussing the questionnaire design, students are guided to include questions such as the following, in order to cover all the mentioned objectives:
  - How many and who are the members of the family (adults / children)
  - Time spent at home

- Use of electric boiler, air-conditioner, etc Are they operating when no-one is at home?
- Coffee machine: how many hours is it on during the day?
- When you are on vacation do you turn off the T.V. completely?
- Do you forget the lights are on and leave them on even when there is no-one in the room?
- How often do you make use of the washing machine and the electrical iron?
- What do you think: saving electric energy at home plays a role in the protection of the environment ?
- 4. During the selection of the equipment by each group, students are guided to make sure there are different ones by considering the power ratings of the equipment. The teacher introduces the units of power and allows the students to undertake a series of exercises to ensure they understand the meaning of pwer and the units used.
  - a. Every group plans its own project according to the given Students' Guide 6. Discuss as a class about questions so as to develop the final form of the questionnaire
- 5. The teacher arranged for the completed questionnaires to be distributed, then discussed in groups and the findings are analysed and presented
- 6. Each group presents the investigation results and calculations to the class
- 7. The teacher guides the discussion of the outcomes from each group; as a class the students conclude, propose and finally decide about:
  - reducing electric energy consumption in a family and at state level (giving special attention to power ratings)
  - informing the members of their family about these matters
  - highlighting the environmental protection

# Achieving the competencies

Competency	To be achieved by	
1 Decide, with justification, how to have	Discussing within the group and	
a balanced electricity bill	recording the decision so as to present to	
	the rest of the class	
2 Designing a questionnaire (as a	Students create the questionnaire as a	
research process) to obtain data on the	group and administer it to families	
major costs on electricity bills		
3. Communicating by presenting the	Students draw their own diagrams, take	
results in a tabular form / diagrams	part in the oral discussions and record	
	justifications for decisions	
4 Cooperating as member of a group	Students cooperate in the group in carry	
carrying out an investigation project	out the project and in making the	
	decisions	
5 Explaining the meaning of power when	Students undertake to complete a written	
used for electrical appliances, rather than	record to explain the meaning of power	
mechanical machines, and the units used		
to measure power		
6 Determining the relationship between	Undertaking calculations of the electricity	
power and energy and be able to calculate	consumed by various appliances in the	
energy consumption knowing the power	home	
of an appliance		
7. Filling the table in the students	To get help from family members to	
worksheet	clarify electrical equipments and their	
	power value.	

# How Happy are You and Your Family with the Electricity Bill?

# Suggested Assessment

This guide to assessment strategies is put forward from different perspectives. In part A the assessment is based on the skill to be developed in the student. Part B is based on the assessment strategies to use in each lesson, whereas part C illustrates the assessment by the 3 different approaches which a teacher may use for formative assessment – observation, by oral communication, or by marking of written work. Summative assessment strategies are not shown, but these could relate to viva type oral communication and/or to the marking of written tests/examination questions.

#### PART A ASSESSMENT BASED ON SKILLS ATTAINED

Able to award a social values grade (objective 1).

Teachers listens to the discussions within the groups and the presentations to the class

- x Not able to contribute to the discussion in a meaningful way
- $\sqrt{}$  Participates in the discussion and is able to record the decision and the justification for this
- $\sqrt{\sqrt{}}$  Not only participates in the discussion and puts forward a point of view but is able to do this with persuasion and can offer counter-arguments to points made by others.

Able to award a science method grade (objective 2).

The teacher marks the student questionnaires before the students to collect data for the community

- x Not able to suggest appropriate items for the questionnaire.
- $\sqrt{}$  Able to suggest items for the questionnaire and to put these into a useful sequence. Able to use the questionnaire to collect relevant data.
- $\sqrt{\sqrt{}}$  Able to suggest key items for the questionnaire which are suitable and relevant for the community and is able to put forward a sampling plan that reflects the need for sampling of the community for a fair result.

Able to award a personal skills grade (objectives 3 and 4).

Teacher observes the students during the group work

- x Does not cooperate with others during the group discussions and activities.
- $\sqrt{}$  Participates in group work meaningfully, in the discussions and in the devising of questionnaires and recording of work in written form.
- $\sqrt{\sqrt{}}$  Not only participates in the group work and in the discussions and written work, but takes on a leadership role helping others to participate.

Able to award a science concept grade (objectives 5, and 6).

- x Not able to explain the meaning of power, the relationship between power and energy and the mechanism for calculating electricity used in the home
- $\sqrt{}$  Able to explain the meaning of power and the relationship between power and energy with the help of the teacher. Able to read an electricity bill and determine the energy used.
- $\sqrt{\sqrt{}}$  Able to fully understand and record in a meaningful way, the meaning of power and its links to energy. Able to read the electricity bill. Can deduce appliances that have been in great use.

#### PART B ASSESSED BY LESSON

Lesson	1
--------	---

	Dimension	Criteria for evaluation	Mark/grade given (x, $\sqrt{,}\sqrt{}$ )
		The student:	
1	Creates a questionnaire	Puts forward appropriate questions for a questionnaire to find out what appliances are used in the home and how much	
		electricity is used per month.	
		Creates an appropriate questionnaire to the level of detail required by the teacher.	
		Develops an appropriate procedure to collect data using their questionnaire	
2	Interpret an electricity bill	Looks at an electricity bill and able to understand the data given in the various columns	
		Draws appropriate conclusions related to the electricity used	

|--|

	Dimension	Criteria for evaluation	Mark/grade given $(x, \sqrt{1}, \sqrt{1})$
		The student:	
1	Interpret or	Interprets data collected in a justifiable	
	calculate from	manner including the use of appropriate	
	data collected	graphs, tables and symbols.	
	and making	Draws appropriate conclusions related to	
	conclusions	appliances using the most electricity.	
		Draws appropriate conclusions related to	
		the appliances used most frequently.	
2	Answers	Provides correct written answers to	
	questions	questions asked by the teacher on their	
		manner of interpretation and drawing	
		conclusions.	
3	Draws	Able to present findings in an appropriate	
	charts/tables.	graphical representation.	
		Able to present graphical representations	
		in suitable detail.	
		Able to provide full and appropriate	
		headings for charts, tables.	

#### Lesson 3

	Dimension	Criteria for evaluation	Mark/grade given $(x, \sqrt{1}, \sqrt{1})$
		The student:	
1	Explanations	Able to explain the meaning of power and	
		the units used.	
		Able to explain the meaning of energy and	
		the units used.	
2	Interpret from	Interprets from the data collected those	
	data collected	appliances which use much power	
	and drawing	compared with other appliances.	
	conclusions.	Draws appropriate conclusions related to	
		the use of such appliances.	

#### Lesson 4

	Dimension	Criteria for evaluation	Mark/grade given $(x, \sqrt{1}, \sqrt{1})$
		The student:	
1	Scientific or	Able to work cooperative with others in	
	socio-scientific	the group and consider the data obtained	
	reasoning	and other factors.	

r	<b>T</b>	
	Gives a justified socio-scientific decision	
	based on efficiency and other factors	
	whether families should be happy with	
	their electricity bill.	

#### PART C ASSESSMENT BASED ON TEACHER STRATEGY

#### Assessment Tool based on the Teacher's Marking of Written Material

	Dimension	Criteria for evaluation	Mark/grade given $(x, \sqrt{1}, \sqrt{1})$
		The student:	
1	Writes a plan or	Puts forward an appropriate research/	
report of an investigation		scientific question and/or knows the	
		purpose of the investigation/ experiment	
		Creates an appropriate investigation or	
		experimental plan to the level of detail	
		required by the teacher	
		Puts forward an appropriate	
		prediction/hypotheses	
		Develops an appropriate procedure	
		(including apparatus/chemicals required	
		and safety procedures required) and	
		indicates variables to control	
2	2 Record Makes and Records observations/data		
experimentalcollected appropriately (in terms of data collecteddata collectednumbers of observations deemed		collected appropriately (in terms of	
	acceptable/accuracy recorded/errors given)		
3	Interpret or Interprets data collected in a justifiable		
calculate from data collectedmanner including the use of appropriate graphs, tables and symbolsandmakingDraws appropriate conclusions related to		manner including the use of appropriate	
		Draws appropriate conclusions related to	
	conclusions	the research/scientific question	
4	4 Answers Provides correct written answers to		
	questions	questions given orally or in written format	
		Provides answers in sufficient detail	
		especially when called upon to give an	
		opinion or decision	
5 Draws charts/ Able to provide graphical representation as			
	diagrams/tables	required	
	/	Able to present graphical representations	
	models/symboli	of a suitable size and in suitable detail	
	c	Able to provide full and appropriate	
	representations.	headings for diagrams, figures, tables	
6	Scientific or	Illustrates creative thinking/procedures in	
	socio-scientific	solving problems	

reasoning Gives a justified socio-scientific decision		
	to an issue or concern, correctly	
	highlighting the scientific component	

#### Assessment Tool based on the Teacher's Observations

	Dimension	Criteria for evaluation	Mark/grade given $(x, \sqrt{1}, \sqrt{1})$
		The student:	
1	Functioning Contributes to the group discussion during		
	in the group	the inquiry phases (raising questions,	
	during	planning investigation/experiment, putting	
	experimentati	forward hypotheses/predictions, analyzing	
	on or	data, drawing conclusions, making justified	
	discussion	decisions).	
		Cooperates with others in a group and fully	
		participates in the work of the group.	
		Illustrates leadership skills – guiding the	
		group by thinking creatively and helping	
		those needing assistance (cognitive or	
		psychomotor); summarising outcomes.	
		Shows tolerance with, and gives	
encouragement to, the group members		encouragement to, the group members.	
2	2 Performing Understands the objectives of the		
theinvestigation/experimental work and knowsinvestigationwhich tests and measurements to perform.or experimentPerforms the investigation/experiment		investigation/experimental work and knows	
		which tests and measurements to perform.	
		according to the instructions/plan created.	
		Uses lab tools and the measurement	
		equipment in a safe and appropriate manner.	
		Behaves in a safe manner with respect to	
		him/herself and to others.	
		Maintains an orderly and clean work table.	
3	Presenting the Presents the activity in a clear and practical		
investigation manner with justified decisions.			
	or experiment	Presents by illustrating knowledge and	
	orally	understanding of the subject.	
		Uses precise and appropriate scientific terms	
		and language.	
		Presents with clarity and confidence using	
		an audible voice.	

	Dimension	Criteria for evaluation	Mark/grade given (x, $\sqrt{,}\sqrt{}$ )
		The student:	
1	1 Questions to Answers questions at an appropriate		
	individuals in	cognitive level using appropriate scientific	
	a Whole	language	
	Class setting	Shows interest and a willingness to answer	
		Willing and able to challenge/support	
		answers by others, as appropriate	
2	Questions to	Able to explain the work of the group and	
	the group	the actions undertaken by each member	
		Understands and can explain the science	
	involved using appropriate language		
	Willing to support other member		
		group in giving answers when required	
		Thinks in a creative manner, exhibits	
		vision and can make justified decisions	
3	3 Questions to Able to explain the work of the group and		
	individuals in	actions taken by each member	
	the group		
		Understands the purpose of the work and	
		shows knowledge and understanding of the	
		subject using appropriate scientific	
		language	
		Can exhibit non-verbal activity	
		(demonstrate) in response to the teacher's	
		questions, as appropriate	

#### Assessment Tool based on the Teacher's Oral Questioning

# How Happy are You and Your Family with the **Electricity Bill?**

# **Teacher Notes**

- It is useful to collect electricity bills (at least 4) from households of one and four persons, with at least one for the winter period and another for a summer period.
- It is useful to have on display different equipment that need electric power to function. (e.g. T.V., iron, electric boiler, computer, electric oven, lights) (Alternatively students can check these apparatus at home, when parents can guide them to find the labelling indicate power consumption).
- Access to an electricity meter (this could be by means of a video/CD)

# **Student Handout**

The following steps /questions are to help you to complete your project successfully:

- 1. Which criteria will you choose for selecting the house equipment?
- 2. Are you sure that you are measuring the consumption of only one piece of equipment at a time? How do you determine this?
- 3. Measure, for a time duration of 5 minutes, the energy consumption of each equipment on the house electric meter.
- 4. Notice the units which are used to measure energy.
- 5. Calculate the energy consumption using the theoretic type (find it in your textbook), for the same equipment and the same period of time. Use the prospectus of the equipment for the power, etc. NOTICE: This step is omitted in the first grades.
- 6. Calculate the amount of money needed to be paid the consumption for each equipment
- 7. Which of the equipment consume more and which the less?
- 8. What is the energy transformation for each piece of equipment?
- 9. Is there a connection between the energy transformation taking place and the consumption?

# **Student Handout 2**

#### Exercise to Aid the Understanding of the Concept of Power

Answer the following:

- 1. On which of the following does the electricity we consume depends? (there may be more than one correct response)
  - (a) the voltage of the appliance;

- (b) the size of the appliance;
- (c) the type of plug used;
- (d) the current supplied to the appliance;
- (e) how long the appliance is in use;
- (f) the age of the appliance.
- 2. For each of those selected in question 1, give the name of the units in which it is measured, both as (a) the base unit and (b) when multiplied by 1000.
- 3. Look at the information supplied on an electrical appliance. Which of the units given in question 2 are observed ?
- 4. As the manufacturer of the appliance does not know when, where or how long the appliance will be used, it can only indicate the power of the appliance. What units (by deduction or otherwise) represent the power of the appliance ?
- 5. Link the units of power to the other units indicated in question 2.
- 6. If an appliance is plugged into the usual mains supply and had a rating of 0.25 amps, what power rating would you see written on the appliance ?
- 7. If the power rating was given as 10 watts, what was the current drawn when the appliance was plugged into the mains supply ?
- 8. The electricity meter needs to record the power of the appliance and the time for which it is used. What units does it use to do this ? What are the units of electricity consumed which are written on the electricity bill ?

#### Watt

The watt (symbol: W) is the SI derived unit of power, equal to one joule of energy per second.

A human climbing a flight of stairs is doing work at the rate of about 200 watts. A first class athlete can work at 375 watts for 30 minutes before exhaustion. An automobile engine produces mechanical energy at a rate of 25,000 watts (approximately 30 horsepower) while cruising. A typical household incandescent light bulb uses electrical energy at a rate of 40 to 100 watts, while the energy-saving compact fluorescent lights which are replacing them use 8 to 20 watts to yield the same light output.

#### Definition

One watt is one joule (the SI unit of energy) per second, that is 1 newton metre per second. It may be visualized simply as the amount of energy expended by a single candle.

$$1 \text{ W} = 1 \frac{\text{J}}{\text{s}} = 1 \frac{\text{kg} \cdot \text{m}^2}{\text{s}^3} = 1 \frac{\text{N} \cdot \text{m}}{\text{s}}.$$

In electrical terms, it follows that:

$$1W = 1V \cdot 1A.$$

That is, if 1 volt of potential difference is applied to a resistive load and a current of 1 ampere flows, then 1 watt of power is dissipated.<sup>[2]</sup>

#### Origin and adoption as an SI unit

The **watt** is named after James Watt for his contributions to the development of the steam engine, and was adopted by the Second Congress of the British Association for the Advancement of Science in 1889 and by the 11th General Conference on Weights and Measures in 1960 as the unit of power incorporated in the International System of Units (or "SI").

#### Confusion of watts and watt-hours

Power and energy are frequently confused in the general media, for instance when a device is said to be rated at "100 watts per hour", which does not make any sense since a watt is a rate of doing work or using energy of 1 joule of energy per second. As a rate itself, a watt does not need to be followed by a time designation, unless one is talking about a change in power over time, analogous to an acceleration or deceleration.

Because a joule as a quantity of energy does not have a readily-imagined size to the layperson, the non-SI unit watt-hour, or rather its multiple the kilowatt-hour, is frequently used as a unit of energy, especially by energy-supply companies (electricity and natural gas suppliers) which often quote charges by the kilowatt-hour. A kilowatt-hour is the amount of energy equivalent to a power of 1 kilowatt running for 1 hour (3.6 MJ).

The watt-hour (symbol  $W \cdot h$  or Wh) is a unit of energy. It is most commonly used on household electricity meters in the form of the kilowatt-hour (kW  $\cdot h$  or kWh), which is 1,000 watt-hours. It is not used in the International System of Units (SI), despite being based on the watt, as the hour is not

an SI unit. The SI unit of energy is the joule (J), equal to one watt-second. It is, however, a commonly used unit, especially for measuring electric energy.

1 watt-hour is equivalent to 3,600 joules (1 W x 3600 s), the joule being the canonical SI unit of energy. Thus a kilowatt-hour is 3,600,000 joules or 3.6 megajoules.

#### Pricing for kilowatt-hours

Power companies sell energy in units of kilowatt-hours. In general, energy (E) is equivalent to power (P) multiplied by time (t). To determine E in kilowatt-hours, P must be expressed in kilowatts and t must be expressed in hours. Suppose a 1.5-kW electric heater runs for 3 h. Then P = 1.5 and t = 3, so the energy E in kilowatt-hours is:  $E = Pt = 1.5 \times 3 = 4.5 \text{ kWh}$  If P and t are not specified in kilowatts and hours respectively, then they must be converted to those units before determining E in kilowatt-hours. Consider a set-up with one 100 W light bulb (0.1 kW) left on for 10 hours per day. This will consume 1 kilowatt-hour per day (0.1 kW x 10 h). If a power company charges \$0.10/kW·h, then this light bulb will cost \$0.70 to operate over the course of a week (0.1 kW x 10 h x \$0.10/kW·h x 7 days in a week) (see unit juggling for more information).

#### from / to Joule Watt-hour Electronvolt Calorie $1 J = 1 kg m^2 s^{-2} =$ $0.278 \times 10^{-3}$ $6.241 \times 10^{18}$ 1 0.239 $2.247 \times 10^{22}$ $1 \text{ W} \cdot \text{h} =$ 3600 1 859.8 $1.602 \times 10^{-19}$ $4.45 \times 10^{-23}$ $3.827 \times 10^{-20}$ 1 eV =1 $2.613 \times 10^{19}$ $1.163 \times 10^{-3}$ 1 cal =1 4.1868

## **CAN TRAFFIC ACCIDENTS BE ELIMINATED BY ROBOTS?**

#### Elementary Science and Technology Grade 7 Teaching- learning Module for Unit Light and Sound

## Abstract

This modules leads to a decision making activity related to ways to decrease traffic accidents. Robotics (in this activity, lego mindstorms NXT 2.0) is used where the main science background will be on the reflection of the light at the grade 6 and 7 level. The activity includes the construction of robots which are able to read different wavelengths of light using light sensor. Various sensors will add to constructed Robots (designed as a model car) and experiments are carried out to seek ways to prevent traffic accidents.

Sectio	Sections Included			
1	Student Activities	Describes the scenario in more detail and tasks the students		
	(for students)	should perform		
2	Teaching Guide	Suggests a teaching approach		
3	Assessment	Gives suggested formative assessment strategies		
4	Teacher Notes	Gives expectations of calculations to be carried out by		
		students		

**Overall Competencies:** The students are expected to:

- Construct a robo-car, controlled by, light sensors for decreasing/increasing the speed of the car according to different- coloured roads and how to present the results in a tabular form/ diagrams.
- Write suitable computer programs using NXT 2.1 programming to control the speed of the car.
- Collaborate as member of a group in designing and carrying out appropriate activities from writing the computer program to solving problems associated with the use of the robot.
- Explain transmitted, absorbed and reflected light, for both white and coloured light and the purity of reflection from different coloured roads.
- Explain wavelength of light in the context of the electromagnetic spectrum and the manner in which light sensors function.
- Decide with justification, whether robots can be viably used to reduce the number of road accidents.

**Curriculum Content:** Transmission and reflection of Light; Light as part of the electromagnetic spectrum.

**Kinds of Activity:** Constructing a robo-car using lego mindstorms NXT 2.0; controlling the speed of the robo-car using suitable computer software related to light sensors; undertake additional experiments to determine the effectiveness of speed control the robo-car related to different coloured/material surfaces; undertake a group discussion so as to make a justified group decision on whether realistic (acceptable, cost effective, reliable) ways can be possible using light sensors to decrease the number of traffic accidents.

#### Anticipated Time: 4 lessons

This unique teaching-learning material is intended to guide the teacher towards promoting students' scientific literacy by recognising learning in 4 domains – intellectual development, the process and nature of science, personal development and social development. Its uniqueness extends to an approach to science lessons which is designed to be popular and relevant. For this the approach is intentionally from society to science to specifically meet student learning needs.

This uniqueness is specifically exhibited by:

- 1. a motivational, society-related and issue-based title (supported in the student guide by a motivational, socio-scientific, real life scenario);
- 2. forming a bridge from the scenario to the scientific learning to be undertaken;
- 3. student-centred emphasis on scientific problem solving, encompassing the learning of a range of educational and scientific goals;
- 4. utilising the new science by including in socio-scientific decision making to relate the science acquired to societal needs for responsible citizenship

# Can Traffic Accidents be eliminated by using Robots?

Name:

Surname:

Class:

# **STUDENT HANDOUT 1**

#### The Scenario

Road accidents cause many deaths in Turkey. There are many reasons for it. The most important reason is the drivers' inattentiveness when they are driving, especially in the late hours. Most Turkish drivers do not follow the traffic signs related to speed limitation and with increased cars on the roads, many traffic accidents have occurred in the past 10 years. According to the Security Department of Turkey, 4236 people died in 2008; 4324 people in 2009 and 4045 people in 2010 as a direct result of traffic accidents. Are you happy with these results?

Would you be interested in exploring ideas about ways traffic accidents can be reduced (and maybe eliminated)? Let us build robot cars and explore how science and technology might be able to play a role using light sensors.

#### Your Tasks

Within the whole class:

- 1. Discuss the meaning of a light sensor and brainstorm ways a light sensor can decrease the number of traffic accidents.
- 2. Present information considered relevant from student group searches on the internet about the properties of light.

In groups:

- 1. Search the internet for information on the property of light, both white light and coloured light.
- 2. Construct a robo-car using lego mindstorms NXT 2.0 (following instructions?)
- 3. Integrate a light sensor to the robo-car (follow instructions or devise their own way?)
- 4. Use different coloured paperboard to make a road for testing the speed of the robo-car (straight or bending)?
- 5. Writing a computer program following a worksheet giving instructions (structured or guided or open guidance ?) for the light sensor using NXT 2.1 programming (which does what tasks information given as structured/guided/open?) and upload it to the robo-car.
- 6. Test your cars' speed (open inquiry no instructions? who decides the criteria for the numbers tests to be performed?) when it passes along different colored roads.
- 7. Check the reliability of outcomes on the different colour roads if road surface differs (smooth, rough, waxed, etc who decides on the different possibilities?) or sloped (who decides on the actual slopes used?).
- 8. Discuss and test other factors that could influence the reliability of the light sensor to work. (Possibilities here could be (a) wavelengths too close (b) reflectivity too low )

As a class:

- 1. Presentation of each group's outcomes (how? (a)from filming, (b)using power point slides, (c)oral report but data written on the blackboard accumulated across all groups), discussion and comparison of each group's outcomes (purpose of this ? –most effective program?)
- 2. Reach final conclusion on: How it might be possible to decrease/increase the speed of cars?
- 3. Discuss the feasibility of integrating the light sensors to all of the cars? Economically? Reliability in all conditions?
- 4. Discuss the feasibility of colouring the traffic roads to limit the speed of the cars? Road maintenance issues?

# **STUDENT HANDOUT 2**

The following steps/ questions are to help you to complete your project successfully:

- 1. What is light?
- 2. How is light reflected?
- 3. What is a light sensor?
- 4. How does a light sensor work?
- 5. How does a light sensor detects objects of different colours?
- 6. How does a light sensor send detected data from different coloured objects?
- 7. Which coloured objects absorb the light best?

Your task is to prepare a presentation using web or sources provided by your teacher and present them in classroom.

# STUDENT HANDOUT 3

1. Please try to understand the working principle of light sensors using NXT 2.0. You will find some technical details of light sensor presented in figure 1.

Figure 1. The technical details of a light sensor

2. Please find the percentages of reflected light using light sensor and fill in the table below.

Colour of carton	Percentage of reflection
Red	
Yellow	
Blue	
Green	
White	
Black	

3. Please decide two colours which are absorbed by light sensors in most and in less.

# **STUDENT HANDOUT 4**

- 1. Please make a robo-car using Lego Mindstorms NXT and blocks. Attached you can find an example to construct a robo-car.
- 2. When you complete your robo-car, please integrate the light sensor to the car.
- 3. Please upload the NXT program to your robo-car using USB cable.
- 4. Please test your robo-car on the roads which is coloured in two different colours.

(It is just an example, you can change the colours whatever you want)

Please note that your robo-car must decrease the speed when it passes the black road and increase the speed when it passes the yellow road. In order to do it, you have to change the power of two engines of the NXT.

You can find the construction steps for robotic-car: **Appendix 1** 

5. Write an appropriate program using NXT 2.1 programming.

The Instruction Steps for Programming the robotic car: Appendix 2

# **STUDENT HANDOUT 5**

Now it is time to::

- 1. Discuss the feasibility of colouring the traffic roads to limit the speed of the cars? Road maintenance issues?
- 2. Discuss the possibility of integrating the light sensors to all of the cars? Do you think that it is economic?

## Can Traffic Accidents be eliminated by Robots?

# **TEACHING GUIDE**

#### The activity relates to:

- Exploring the reflection of light on the different surfaces.
- Understanding the absorption of the light on the different surfaces.
- Understanding the function of light sensor.
- Introducing the concept of light.

#### **Lesson Learning Outcomes**

#### Lesson 1

At the end of this lesson, students are expected to be able to:

- Be familiar with NXT 2.0 programme
- Construct the robot kits for robo-car

#### Lesson 2

At the end of this lesson, students are expected to be able to:

- Understand the working principles of light sensor
- Integrate the light sensor to the robo-car
- Prepare different coloured paperboard to make a road for testing the robo-car

#### Lesson 3

At the end of this lesson, students are expected to be able to:

- Notice that light is absorbed by the object at the end of the interaction between object and light
- Know that why different coloured paperboards are used for testing the speed of robo-car
- Explore the light is absorbed more with dark colour

#### Lesson 4

At the end of this lesson, students are expected to be able to:

- Understand the reflection of light
- Understand the absorption of light
- Determine the colours which absorbed much light
#### Suggested Teaching Strategy

- 1. Lesson begins with the socio-scientific issue which occurs in the scenario.
- 2. Teacher explains the role of robotics and light sensor for solving the problem in the scenario and gives information about this.
- 3. Students who are divided into groups (maximum 5 students) construct a robotic car by using robotic kits and integrate light sensor to the robotic car.
- 4. Students write a suitable computer programme by using NXT 2.1. They upload them to the robotic car.
- 5. Results are discussed in the classroom by students.

# **Can Traffic Accidents be eliminated by Robots?**

This guide to assessment strategies is put forward from different perspectives. In part 1 the assessment is based on the skill to be developed in the student. Part 2 is based on the assessment strategies to use in each lesson and illustrates the assessment which a teacher may use for formative assessment like observation.

	Degrees						
Skills	Low	Acceptable	Mean	Good	Perfect		
		(2)	(3)	(4)	(5)		
	Social Va	lues					
Able to distribute the tasks within the							
group							
Able to perform teamwork							
Able to contribute to the discussion in a							
meaningful way							
Р	ersonal S	kills					
Willing to perform the project							
Able to think critical							
Able to be creative							
Able to present the subject in an							
interesting way							
Able to have self-confidence during the							
presentation							
Willing to present the subject to the class							
Able to indicate opinion when asked							
Using	g Science	Method					
Able to apply different sources to gather							
information							
Able to make the observations carefully							
Able to determine the purpose of the							
project							
Able to make an appropriate working plan							
for the project							
Able to analyze data collected							
Able to make inferences							

#### Part 1 Assessment based on Skills

	Dimension	Criteria for evaluation	Mark/grade given
Lesson 1	Make Arrangements		
Lesson 2	Construct robo-car	Presents the answers of questions given in Student Handout 1 Carries out simple experiments with NXT programme Uses appropriate blocks for constructing a robo- car Integrates the light sensor to the robo-car	
Lesson 3	Testing robo-car		
Lesson 4	Make	Draws appropriate conclusions related to the robo- car Gives opinions about decreasing the number of traffic accidents by using robots	

Part 2 Assessment based on lesson

## **TEACHER NOTES**

# **Can Traffic Accidents be eliminated by Robots?**

For the Lego Mindstorms NXT 2.0

- The students should have background information about Lego Mindstorms NXT 2.0 and its working principle to work with them.
- It will take one hour class time to teach your students about Lego Mindstorms if they do not have such background.
- The detailed information can be found on the Lego Mindstorms NXT 2.0 web page: www.mindstorms.lego.com

For the Science and Technology Curriculum

- It is useful to show different equipment which has a light sensor.
- It is also useful to show traffic accident videos and some statics about traffic accidents.
- It is useful to show some about light (especially reflection of light).

#### Light

Light is made of billions of tiny particles called photons. These photons travel from one place to another in waves. Visible light is the subset of photons that move at a wavelength that we can see. Among the different photons that are in visible light, the ones that have the longest wavelength look red to us, and the ones that have the shortest wavelength look blue to us. All colours come from different wavelengths of light.

#### **Reflection of Light**

Reflection occurs when light bounces off objects. How much reflection depends upon how even the surface is. If the surface is rough, the light scatters. If the surface is smooth and flat, the light will bounce off it at equal angles. That is why a flat mirror reflects a good likeness of the object being reflected.

Look at the diagrams below. Notice the angles at which the light (shown as rays) strikes the surfaces.

#### Light Sensor Block

This sensor detects ambient (surrounding) light. Using data wires, it can send out the current light value and a logic signal (true/false) based on whether the current light value falls above or below a trigger point.

A trigger point is the specific value in a range of numbers where a change in condition occurs. For example, you might program your robot to move forward only when the light level rises above 60%. The trigger point would be 60.

Specify the trigger point by using the slider or by typing a number into the input box. To specify the range (above or below the trigger point) that will generate the "true" signal, use the radio buttons or the pull-down menu. The "true" portion of the range will be in colour; the "false" portion will be gray.

The default setting for the light sensor block is for light levels above 50% to generate a "true" signal. The radio button to the right of the range is selected and the slider is set at 50. To switch the "true" portions of the range (setting values below 50% as "true"), you would select the left radio button.

The feedback box in the configuration panel shows the current light value. (To receive feedback, make sure that the light sensor is connected to the chosen port and that communication has been established with the NXT.)

You must drag at least one output data wire from this block's data hub to another block for any information to be sent. (See the Data Hub section below for more information.)

#### *Tip: How do I set the Trigger Point for a Light Sensor?*

If you want a flashlight pointed at your robot to generate the "true" signal, try pointing a flashlight at your robot a few times and watching the light values displayed in the feedback box. If the flashlight generates light levels of around 80%, you might set the trigger value at 70. That way, bright light above 70% (like from the flashlight) will generate a "true" signal. Weaker light will be ignored.

The trigger point can also be set dynamically with an input data wire.

#### Detecting the Light Sensor's own Reflected Light

If you check the "Generate Light" checkbox, the light sensor will turn on its own small light source and detect this light if it is reflected back to it. This function is especially useful in difficult lighting conditions like very bright rooms. The function also allows the light sensor to serve as a shortdistance range finder. With "Generate Light" turned on, a light sensor approaching a reflective object will detect higher reflected light levels. Therefore, it is possible to use the sensor to avoid running into obstacles.

#### **Display Settings**

- 1. The number shows which of your NXT's ports are connected to the light sensor. You can change this number in the configuration panel if you need to.
- 2. This icon indicates at what level the trigger point is set. The more coloured bars displayed, the higher the trigger point.
- 3. This icon is displayed if "Generate Light" is turned on.
- 4. The block's data hub will open automatically when the block is placed in the work area. At least one data wire must be dragged from the block's output plug to another block's data hub. (See the Data Hub section below for more information.)

#### **Configuring the Light Sensor Block**

Light Sensor	✔ Port: ① ○1 ○2 ○3 ○4
- <u>Ö</u> -	💯 Compare: 🕐 🛞 —————————————————————————————————
× 1 ×	2) Light: > 🔽 50
4	🌽 Function: ③ 🗹 🏇 Generate light

- 1. Choose the port where your light sensor is plugged in. By default, the block will be set to port 3 for a light sensor. You can change this selection if you need to.
- 2. Use the slider to set the trigger value or type a value directly into the input box. Select the radio button to the right of the slider if you want the block to be triggered by light levels higher than the trigger value; select the left radio button to trigger the block with light levels lower than the trigger value. You can also use the pull-down menu to set the "true" portion of the slider.
- 3. If you check the "Generate Light" checkbox, the light sensor will turn on its own small light source and detect this light if it is reflected back to it.
- 4. The feedback box displays the current light reading (0-100%). You can use it to try out different trigger values.

#### Configuring the Light Sensor block's Data Hub

You can control the Light Sensor block dynamically by connecting data wires (from other blocks' data hubs) to the Light Sensor block's data hub.

Open a block's data hub by clicking the tab at the lower left edge of the block after it has been placed on the work area.

Data wires carrying input information to a block are connected to the plugs on the left side of its data hub. Data wires carrying output information are connected to the plugs on the right side.

[A] Input plug
[B] Output plug
[C] Number data wire (yellow)
[D] Logic data wire (green)
[E] Text data wire (orange)
[F] Broken data wire (gray)

#### Passing data from the input plug to the output plug

If an input plug has a corresponding output plug (see A above), the input data will pass through from the input plug to the output plug without being changed. In this case, you can only use the output plug if the input plug is connected to an input data wire; connecting an output data wire to such an output plug without a connected input data wire will cause the output data wire to be "broken" (and coloured gray).

#### Data wires carry specific types of data

Each data wire carries a specific type of data between blocks. For example, if a data wire is dragged from a logic plug on a block's data hub, it can only be connected to a logic plug on another block's data hub. The chart below shows what kind of data each plug can accept or send out.

#### Data wire colours

Data wires are identified with specific colours: wires carrying number data are coloured yellow, wires carrying logic data are coloured green, and wires carrying text data are coloured orange.

#### "Broken" data wires

If you try to connect a data wire to a plug of the wrong data type, the data wire will be broken (and coloured gray). You will not be able to download your program if a data wire is broken.

If you click a broken wire you can read why it is broken in the small help window in the lower right corner of the work area.

#### Data must be within the possible range of the plug

If an input data wire transmits a value outside the possible range of the plug it is connected to, the block will either ignore the value or change it to a value within its range. For plugs that allow just a few input values (example: just 0, 1, or 2), the plug will ignore the input if a value arrives outside its range.

For plugs that accept larger input ranges (example: 0 - 100), the plug will force any input outside its range to fit. For example, if a Move block's Power plug receives an input value of 150, the block will change the input value to 100 (i.e., a number within the Power plug's range).

This	chart	shows	the	different	characteristics	of the	plugs o	on the	Light	Sensor	block's	data
hub:												

	Plug	Data Type	Possible Range	What the Values Mean	This Plug is Ignored When
a) (°	Port	Number	1 - 4	1 = Port 1, 2 = Port 2, 3 = Port 3, 4 = Port 4	
a 😳 (a	Trigger Point	Number	0 - 100	Value to compare against	
a 🇞 🖪	Greater / Less	Logic	True/False	Logic used in comparison. True = Greater, False = Less	
e 🚸 e	Generate Light	Logic	True/False	Determines if the sensor's own LED is on or not	
e í 🖌	Yes / No	Logic	True/False	Result of comparison	
ē <b>⊒</b> [s	Intensity	Number	0 - 100	Scaled value read from sensor.	
a 🎟 (a	Raw Value	Number	0 - 1024	Raw (unscaled) value read from sensor	

#### **Colours and Light absorption**

Dark colours do not exactly absorb more heat, but they do convert a higher percentage of light into heat. If you notice when heading out in the sun with a dark coloured shirt it gets hot, where a lighter coloured shirt would not get nearly as hot. This is due to the amount of light being absorbed by the colour. The lighter the colour, the smaller the range of visible light being absorbed and converted into heat.

White objects reflect all visible light, where black objects absorb all visible light. This is also why we call both dark coloured objects and poorly lit objects dark.

While colour is a factor of light absorption, it is not the only factor. You will find that some dark objects remain cooler in direct sunlight then other lighter objects. This is due to the fact that there are other factors at play, maybe one material is a poorer insulator; possibly there is a shine to darker object, leading more light to be reflected as a result. But if all but the colour is the same, you will find that darker colours do become hotter when exposed to light.

#### APPENDIX 1: CONSTRUCTING A ROBOTIC-CAR WITH COLOR SENSOR

#### **APPENDIX 2: Programming Robotic car**

Move: Allows robot's movement

Record/Play: Records sound and plays it

Sound: Allows robots make different sounds

Display: Allows to monitorize writing on robot's screen

Wait: Allows robot stop for a while

Loop: Allows to replay action.

Switch: Allows robot to select one of two actions

#### **Programming Steps**

- 1. Click the "Move" button and add the icon on your programming table. Then following:
  - Choose B and C ports for engines
  - Choose "forward" in "directions" part
  - Set the engine power to 75 in "power" part
  - Change the selection as "unlimited" in duration part

- 2. Choose light sensor in "wait" part of the left menu. Then the following:
  - Choose "sensor" in "control" part
  - Set the sensor as "light sensor" in "sensor" part
  - Choose "port 1" for light sensor
  - Set the light option as <30 in "until" part
  - Choose "generate light" in "function" part

Wait	Control:	Sensor	Port	. 01	O 2 (	03 04
	Sensor:	Light Sensor	Unti	l: 💿 🎲	-0-	<u>\$</u> 0
				Light:		< 🔽 30
0			P Func	tion: 🖂 🔆	🖗 Generate lig	jht

- 3. Click the "Move" button and add the icon on your programming table. Then following:
  - Choose B and C ports for engines
  - Choose "forward" in "directions" part
  - Set the engine power to 25 in "power" part
  - Change the selection as "5 seconds" in duration part
  - Choose "brake" in "next action" part

- 4. Choose light sensor in "wait" part of the left menu. Then the following:
  - Choose "sensor" in "control" part
  - Set the sensor as "light sensor" in "sensor" part
  - Choose "port 1" for light sensor
  - Set the light option as >30 in "until" part
  - Choose "generate light" in "function" part

- 5. Click the "Move" button and add the icon on your programming table. Then following:
  - Choose B and C ports for engines
  - Choose "forward" in "directions" part
  - Set the engine power to 75 in "power" part
  - Change the selection as "10 seconds" in duration part
  - Choose "brake" in "next action" part

6. Then connect your NXT to computer and click "Download" button and program will be uploaded to your NXT.

7. Stick your white and black paperboards on the floor. The white ones can be as long as you want but black one should be 40 cm.

8. Put the robot on the road and push "Run" button on NXT.

# HOW CAN WE CREATE AN ICE-CREAM CAR WHICH GOES ON THE BEACH USING WIND?

<sup>7th</sup> Grade science and technology module on Forces, Friction and Renewable energy

### Abstract

This module leads to a decision making activity, designed to consolidate learning about Design and technology; Using mechanisms – gearing down, Assembling components, Combining materials, Renewable energy, Measuring area, Measuring distance, Measuring time, Forces, Friction, Air resistance, Pressure, Scientific investigation, taking examples from everyday life and to introduce the friction, energy and power.

Section	ons included	
1.	Student activities	Describes the scenario in more detail and the tasks the
	(for students)	students should perform
2.	Teaching guide	Suggests a teaching approach
3.	Assessment	Gives suggested formative assessment strategies
4.	Teacher notes	Gives expectations of calculations to be carried out by
		students

The module is designed and created by Bulent Cavas, Selin Nur Sayar and Duygu Seyman

#### **Overall Objectives/Competencies:**

The students are expected to: 7.2.4.2. explain the effects of friction on the kinetic energy 7.2.4.2. give examples connected to the air and water resistance.

#### Curriculum content: force and motion

#### Kind of activity:

Design and technology; • Using mechanisms – gearing down • Assembling components • Combining materials

Science • Renewable energy • Measuring area • Measuring distance • Measuring time • Forces • Friction • Air resistance • Pressure • Scientific investigation

#### Anticipated time: 4 lessons

This unique teaching-learning material is intended to guide the teacher towards promoting students' scientific literacy by recognising learning in 4 domains – intellectual development, the process and nature of science, personal development and social development.

Its uniqueness extends to an approach to science lessons which is designed to follow a 3 stage model. For this the approach is intentionally from society to science and attempts to specifically meet student learning needs.

This uniqueness is specifically exhibited by:

- 1. a motivational, society-related and issue-based title (supported in the student guide by a motivational, socio-scientific, real life scenario);
- 2. forming a bridge from the scenario to the scientific learning to be undertaken;
- 3. student-centred emphasis on scientific problem solving, encompassing the learning of a range of educational and scientific goals;
- 4. utilising the new science by including in socio-scientific decision making to relate the science acquired to societal needs for responsible citizenship

# HOW CAN WE CREATE A CAR WHICH GOES ON THE BEACH USING AIR POWER?

## **Student Activities**

The Scenario

Ege, Deniz and Efe are very closed friends and lives in Çeşme-Alaçatı\* where is a windy place in Turkey. Unfortunately, one day they learned that Efe is very ill and he is getting worse day by day. Efe needs to go Istanbul in order to have some advanced medical tests. However, Efe's family is poor and they do not have enough money to send Efe to Istanbul and for advanced medical tests.

Ege and Deniz decide to sell ice-creams in Alaçatı-beach for supporting Efe to go Istanbul. In order to sell ice-creams in beaches, they need to build an ice-cream car that can move on the beach using air power. They know that they have enough wind in beaches and they want to use wind for moving their ice-cream car.

Would you like to help Ege and Deniz to build an ice-cream car using lego kits?

\* Placed on the Cesme Peninsula, contrary to the Hellenic island Chios, Alacati is the perfect surf point in the Turkish Aegean Sea. Who does not dream of rushing over flat, Turquoise water with incessant wind? With Izmir just a 3 hour flight away, and the transferral to Alacati only 60 minutes, this perfect localisation is staggeringly approachable.

#### Construction

#### Warning!

Fans are potentially dangerous. Make sure that children handle them with great care!

#### Make your test track

Stick a 1,5 metre strip of masking tape across a stretch of floor and mark it off every 10 cm from the fan. Now we are ready to build models!

#### Build the ice-cream car

You can use following pages to build your car.

# **Building Instruction**

# Ice-Cream Car

How can you make a safe car that is powered by the wind and carries at ice creams box? Let's find out!

#### **Investigation 1:**

What difference does the size of sail make?

- Please note that the front wheel should be on the starting point.
- The fan should be placed 20 cm far away from starting point.

• Turn on the fan, predict and test how FAR each model will roll with the same wind speed in normal road with regular surface and in roads with full of stones.

• Test at least 3 times with each sail to achieve a scientifically valid answer NB. FANS and FINGERS! TAKE CARE!

	My prediction (cm)	Actual Distance (In regular surface) (cm)			Actual Distance (surface with full of stones) (cm)		
<b>Small</b> 40 cm² sail							
<b>Medium</b> 80 cm² sail							
<b>Large</b> 160 cm² sail							

Table 1. Size of sail and its effect on the movement of the car

## **Investigation 2:**

What difference does wind angle make in road with full of stones?

- Launch your car at different angles across the wind stream

How fast does it travel in each time?Write the words to the table 2 in the

following page to match you saw happening

#### The words

Stopped Medium speed Fast Slow

	Angles	Large 160 cm <sup>2</sup> sail
,	Angle A	
My Prediction	Angle B	
	Angle C	
	Angle D	••••••
	Angle A	
The results	Angle B	••••••
	Angle C	•••••••••••••••••••••••••••••••••••••••
	Angle D	•••••••••••••••••••••••••••••••••••••••

# My Land Sailor

Draw and label your design for a wind-powered vehicle. Explain how the 3 best bits work.

# **Teachers'** Note

#### **Design and technology**

- Using mechanisms gearing down
- Assembling components
- Combining materials

#### Science

- Renewable energy
- Measuring area
- Measuring distance
- Measuring time
- Forces
- Friction
- Air resistance
- Pressure
- Scientific investigation

## Vocabulary

- Area
- Wind resistance
- Renewable energy
- Gearing down
- Friction

# Other materials required

- 4-metre strip of smooth floor
- Masking tape
- Metre rule or measuring tape
- Timer or stopwatch
- 3-speed desk fan
- Optional: card, scissors, pencils and rulers to make your own sails

## **Course Plan**

First lesson: reading scenario and building car Second lesson: Investigation 1 Third lesson: Investigation 2 Fourth lesson: Assessment and feedbacks

# Contemplate

What difference does sail size make?

Predict and test: what difference could there be between the 40 (small), 80 (medium) and 160 (large) cm2 sails on the car. How far will each roll ... and (optional) how fast? Test at least 3 times with each sail attached to obtain a scientifically valid answer.

In our tests, the '40' sail rolled about 1.5 m, the '80' about 2 m and the '160' about 2.5 m, i.e. double the area gathers more wind energy but does not double the distance. Why? The further from the fan, the weaker the wind! Larger sails moved faster at first. But all the sail sizes stopped rolling after about 10 seconds. None of them sail faster than the wind – downwind.

What if the wind is blowing from an angle? Launch your Land Yacht at different angles across the wind stream.

#### Can you explain what happens?

At most angles except D the car still moves forward! One part of the wind's force is 'deflected' off the sail, propelling it 'forward'. The other part of the force tries to blow it sideways. In fact a Land Yacht sailing across the wind at angles B and C can go very fast – but could also flip over.

Did you know? The LEGO® figure weighs 3 g. The yacht weighs about 55 g. The weight brick is 53 g. Predict and test how the yacht would perform with a weight brick load.

#### Does sail shape matter?

Try making card or paper sails with the same area but a different shape. Find out about Square Riggers, Kon Tiki, Chinese Junks and Arab Dhows from books or by searching the internet.

#### **Explanations on the concepts**

**Renewable energy** is made from resources that Mother Nature will replace, like wind, water and sunshine. Renewable energy is also called "clean energy" or "green power" because it doesn't pollute the air or the water. Renewable energy is generally defined as energy that comes from resources which are naturally replenished on a human timescale such as sunlight, wind, rain, tides, waves and geothermal heat. Renewable energy replaces conventional fuels in four distinct areas: electricity generation, hot water/space heating, motor fuels, and rural (off-grid) energy services.

A **force** is a push or pull on matter. Forces are the cause of motion. Forces have magnitude (size) and direction. The direction of the force is important. An object that is not subjected to a force will move at a constant speed and in a straight line. Some forces reinforce or cancel each other out. Forces that are different in size and direction will cause changes in the speed or direction of an object's motion. A common unit used to measure force is known as the Newton (N).

Friction is a force that slows down motion. Larger forces create more friction.

**Friction** is a force that holds back the movement of a sliding object. That's it. Friction is just that simple. Frictional resistance to the relative motion of two solid objects is usually proportional to the force which presses the surfaces together as well as the roughness of the surfaces.

Air resistance is the force that resists the motion of an object through a gas and liquid is called drag. For objects moving through air sometimes instead of drag the term air resistance is used. As an object moves through air, the gas molecules in the air push against the surface of the moving object resulting in friction between the gas molecules in the air and the surface of the moving object.

**Pressure** is the force over a given area. Given the same force, the smaller the area of contact, the more pressure is applied. One important type of pressure is the pressure exerted on objects from the air or the Earth's atmosphere. This is actually the measurement of the weight of the gas above an object on a given surface area. The higher the elevation, the lower the atmospheric pressure exerted because there is less air pressing down on the object.

# ASSESSMENT SHEET

#### **1.** Which of the following does not involve any friction?

- a. A bicycle rolling down a hill
- b. A baseball player sliding into 2nd base
- c. A diver falling through the air to a pool
- d. All of the above experience some friction.

#### **2.** Which surface will produce the least amount of friction?

- a. fuzzy soccer field
- b. gravel running track
- c. smooth glass tabletop
- d. grassy soccer field

## **3.** These two factors determine the strength of the force of friction:

- a. speed and light
- b. how fast the objects are going and on what planet
- c. how big the objects are and how hard you push them
- d. how hard the surfaces push together and the types of surfaces involved

# **4.** The amount of charge that builds up due to the friction between two materials depends on the

- a. weight of the materials
- b. surface area in contact
- c. electrical conductivity of the materials
- d. lattice structures of the materials

## **5.** Sports shoes tend to have rough bottoms. What is the best explanation for this?

- a. To decrease friction so you move faster
- b. To increase friction so you can change your motion more easily
- c. To decrease your mass so you have more momentum
- d. To reduce gravity and make you lighter

## **6.** An example of rolling friction is

- a. a stack of cartons being pushed across a floor.
- b. the use of ball bearings.
- c. the fall of a feather through the air.
- d. sand placed on an icy sidewalk.

## 7. Cars have difficulty stopping on ice because of

- a. rolling friction
- b. sliding friction
- c. fluid friction
- d. centripetal force

# **8.** The force that opposes the motion of two surfaces sliding past each other is called \_\_\_\_\_\_.

- a. acceleration
- b. inertia
- c. resistance
- d. friction

# **9.** Friction is a force that keeps

- a. two objects together
- b. objects that are touching each other from sliding past each other easily
- c. objects from touching
- d. none of the above

# **10.** Force that works against the movement of two objects is called:

- a. Friction
- b. Solar
- c. Mixing
- d. Burning
